

Sexual Crimes

1. Investigation of sexual offences. Most attrition (i.e. victims ceasing to support the investigation and prosecution) occurs early on in the investigative process, long before decisions about whether or not to prosecute are made (Brown, Hamilton, & O'Neill, 2007; Fitzgerald, 2006; Hansen, Nielsen, Bramsen, Ingemann-Hansen, & Elklit, 2015; Kelly, Lovett, & Regan, 2005). Deception in statements or interviews

2. Detection of deception. When comparing true accounts to lies, true accounts tend to contain more words, more unique detail, more sensory information, more words overall. Lies tend to be less plausible, contain repeated details, lack contextual embedding, have more omissions. The average human is right about whether someone is lying or telling the truth about 54% of the time (C. F. Bond & DePaulo, 2006). In original article:

Geography in offending

3. Distance decay. The further away a location is from an offender's home or base, the less likely it is that they will offend in that location. In original article:
